DADI VS SCAMMERS · PUKAAR · APNI AWAAZ

One Gnani voice engine, three products for India

Team: Nitya Prakash Pandey & Dilavesh Kanz Nidooli · Built on Gnani **Prisma v3.0** (speech-to-text), **Timbre v3.0** (text-to-speech) and **Gnani voice cloning** · One shared realtime engine (barge-in, in-character fillers, echo guard, reconnects, a request gate for Gnani's one-request-per-key limit) powers all three.

Live demos: Dadi vs Scammers dadi-vs-scammers.vercel.app · Pukaar pukaar-snowy.vercel.app · Apni Awaaz apni-awaaz-kappa.vercel.app | **Videos (all three):** Google Drive folder

1. Dadi vs Scammers: *don't block scammers, route them to Dadi* (flagship)

Problem. Indians lost **₹22,845 crore** to cyber fraud in 2024 (MHA via Inc42); in 2025, **1,03,488 senior citizens** reported losing ₹4,005 crore (MHA via ANI). A fake "CBI" call took ₹7 crore from industrialist S.P. Oswal (Scroll). Blocking a number costs the scammer nothing; he dials the next grandmother.

Product. An AI grandmother in Hinglish, Tanglish, Benglish, Kanglish and Tenglish answers the scam call, wastes his time with a tactic planner and steers him into revealing his **UPI IDs and mule accounts**; mid-call she hands the phone to grandson Bunty. Every call becomes a complaint draft for cybercrime.gov.in / 1930 / Chakshu, a SHA-256-sealed two-track recording and a bank freeze list. Gnani voice cloning doubles as a **voice fingerprint**: a scammer who calls back under a new name is recognised mid-call, and the Scam Ring Radar links his calls. Guardian mode warns a real elder during her own call.

Proof (live, Gnani servers, 10 Nov). Prisma 67–170 ms per line; in 95 s Dadi got his UPI ID, phone number and AnyDesk demand; the same scammer voice under a new name matched at **0.956** and Dadi said: "*तब कहते थे पुलिस वाले हैं, अब SBI वाले?*"; Bunty extracted the UPI ID and IFSC in 71 s; 256 tests pass.

Different from Apate.ai (Australia) and O2's Daisy (UK): to our knowledge, no other scam-baiting voice agent speaks Indian code-mix and turns the call into UPI/mule identifiers, evidence and a complaint for India's reporting channels.

2. Pukaar: every flood call answered, in the caller's language

Problem. During Cyclone Michaung in Chennai, "almost every call to the complaint cell went unanswered till December 7" (DT Next). In Kerala 2018, 483 people died and volunteers' keralarescue.in received over 1 crore aid and rescue requests (ThePrint).

Product. An overflow emergency line that answers when no human can: it calms the caller in Tamil, Hindi, Telugu or English code-mix, gives only approved safety instructions, never promises a time or says "you are safe", scores severity with transparent rules, locates callers from spoken landmarks and merges duplicate callers into one incident on a control-room map. It ranks the best rescue team with reasons (a human confirms every dispatch), interprets live between a Hindi-speaking rescuer and a Tamil caller, and broadcasts alerts in 7 languages as CAP 1.2 (the standard NDMA's SACHET uses).

Proof. Severity rose to critical 90 as facts arrived on a live Tamil call; triage accuracy unchanged from clean audio to 0 dB rain; live interpreter 2.3 s one way, 1.6 s back; 277 tests pass.

Different from Bengaluru's VANKI and Telangana's AI-ERSS, which assist human 112 call-takers: Pukaar answers the overflow call itself.

3. Apni Awaaz: your own voice, back

Problem. India had **2,05,878** new lip and oral cavity cancer cases in GLOBOCAN 2024, the most common cancer in Indian men (IARC); many survivors lose their voice. Apple Personal Voice supports no Indian language and needs a recording made before the voice is lost (Apple).

Product. Gnani voice cloning rebuilds a person's own voice from voice notes they already have, with mandatory consent and one-tap delete. They type (romanised Hindi works), tap quick phrases, say where it hurts on a body map, or pick a suggested reply while live captions show what the nurse says, and the app speaks in **their own voice in 10 Indian languages**. Visit notes read the doctor's instructions back in their voice; switch scanning and an offline SOS cover stroke and ALS users.

Proof (live). Voice built in 0.67 s; a sentence in the cloned voice in 1.5–2.2 s; Tamil spoken in a Hindi speaker's cloned voice, re-transcribed by Prisma word for word; 244 Python and 12 JavaScript tests pass.

Different from ElevenLabs' Impact Program (a general platform you apply to) and Avaz/Jellow (stock voices): a free, India-first conversation app around your own voice.

Honesty notes. All demo calls and voices are synthetic. Live dialogue runs on Groq (`qwen/qwen3.8-27b`); Evon v3.3 plugs into the same adapter but has no hosted API. Code: dadi-vs-scammers · pukaar · apni-awaaz · #GnaniAI #GreatIndianAIInternshipChallenge
